

The Turkish Chemical Company, which is an expert in its field, uses the KIMO Access Control and Management System!

Our client's request was to ensure the physical security of the work areas and secure access of the employees to these areas, and to assist the Human Resources with the T&A.

ÖLÇSAN analyzed the requirements for the physical security of the institution and implemented the project with the KIMO Platform, which uses HID access control panels and readers, which combine high technology and comfort. Only relevant persons enter the production areas. All transitions that will adversely affect the production process or service area are prevented. Control is done from a single point. The installed system instantly detects which unit the employees in the center and facility are in. It is ensured that the working personnel enter and exit the parking area and rooms safely. The Human Resources Unit carries out many transactions related to personnel such as embezzlement, leave, etc. The working hours of the personnel are followed and daily, weekly, monthly and hourly entry-exit reports are obtained.

With cloud support and easy integration of 3rd party products, the access control system continues to serve as user-friendly in corporate facilities.
